

AI Consulting Copilot

An Intelligent Agent System for AI Discovery Workshops

Version 1.0

Concept Document

1. Executive Summary

Organizations increasingly seek to understand how Artificial Intelligence can transform their operations, yet many struggle to identify high-value use cases and build a clear implementation roadmap. Traditional consulting workshops aimed at identifying AI opportunities often require multiple consultants, several days of interviews, and weeks of post-workshop analysis to generate actionable insights.

AI Consulting Copilot is an intelligent multi-agent system designed to **facilitate AI discovery workshops autonomously**. The platform acts as an **AI facilitator, strategist, and analyst**, guiding participants through structured exercises, collecting real-time input, synthesizing insights, and producing consulting-grade outputs.

Within a single workshop session, the system enables organizations to:

- Identify business challenges and automation opportunities
- Generate and evaluate AI use cases
- Reach consensus across stakeholders
- Assess AI readiness
- Prioritize opportunities based on impact and feasibility
- Produce a strategic AI roadmap and presentation deck

The result is a **structured, interactive, and insight-driven discovery workshop** that compresses weeks of consulting work into a single collaborative session.

2. Vision

The long-term vision of AI Consulting Copilot is to become a **digital AI strategy partner** that enables organizations to rapidly explore, evaluate, and plan AI adoption.

Rather than replacing consultants entirely, the system **augments consultants and strategy teams**, allowing them to focus on higher-level advisory work while the platform handles:

- workshop facilitation
- insight extraction
- structured analysis
- documentation and reporting

Over time, the platform evolves into a **scalable AI consulting infrastructure** usable by consulting firms, innovation teams, and enterprise transformation leaders.

3. Core Objectives

The AI Consulting Copilot platform aims to achieve the following objectives:

1. Accelerate AI Discovery

Enable organizations to quickly identify where AI can create value within their operations.

2. Structure Strategic Conversations

Provide a guided workshop process that moves participants from **problem identification** → **idea generation** → **strategic prioritization**.

3. Capture Organizational Intelligence

Collect insights from multiple stakeholders simultaneously and transform them into structured knowledge.

4. Enable Evidence-Driven Decisions

Use live polling, consensus detection, and prioritization frameworks to ensure decisions are data-driven.

5. Generate Consulting-Grade Deliverables

Automatically produce outputs typically created by consulting teams, including strategy decks, use-case lists, and implementation roadmaps.

4. Workshop Experience Overview

The AI Consulting Copilot conducts structured discovery workshops through a sequence of interactive phases.

Each phase collects data from participants and progressively builds strategic insights.

Workshop Phases

1. Workshop Setup and Participant Onboarding
2. Business Context Discovery
3. Problem Identification
4. AI Opportunity Generation
5. Prioritization and Consensus
6. AI Readiness Assessment
7. Roadmap and Strategy Generation
8. Deck and Report Generation

These phases mirror the workflow used by consulting firms when conducting AI strategy workshops.

5. Workshop Flow in Detail

Phase 1: Workshop Setup

The workshop begins with participant onboarding and context establishment.

Participants join via a shared workshop link or QR code and provide basic information such as:

- role
- department
- strategic priorities

The system immediately builds a **stakeholder distribution map**, enabling the platform to understand organizational perspectives present in the session.

This phase establishes the foundation for structured insight gathering.

Phase 2: Business Context Discovery

The AI facilitator begins by asking strategic questions about the organization.

Typical inputs collected include:

- business objectives
- growth priorities
- operational challenges
- strategic initiatives

Participants respond through live polls or short answers.

The system aggregates responses and identifies dominant themes such as:

- revenue growth
- operational efficiency
- customer experience improvement

Insights generated during this phase form the **business objective map** used throughout the workshop.

Phase 3: Problem Discovery

The next phase focuses on identifying operational pain points and inefficiencies.

Participants are asked to identify tasks that are:

- repetitive
- time-consuming
- manual
- error-prone

Examples may include:

- customer support ticket handling
- lead qualification processes
- manual reporting
- document processing

The system automatically clusters responses into **problem categories** and highlights patterns emerging across departments.

Participants then rank problems based on severity and impact.

Phase 4: Prompt Engineering Exercise

To help participants understand AI capabilities, the workshop introduces a practical exercise where participants design prompts that could automate tasks within their workflows.

Participants submit prompts describing how AI could assist in a task.

The system evaluates prompts based on several dimensions:

- clarity
- context provided
- constraints
- expected output structure

Participants receive feedback and improved prompt suggestions.

This exercise serves two purposes:

1. Demonstrating how AI can be applied to real workflows
2. Generating insights about automation opportunities

Phase 5: AI Opportunity Generation

Using the collected inputs from previous phases, the system generates potential AI use cases tailored to the organization.

Inputs used for generation include:

- problem clusters
- participant prompts
- industry benchmarks
- strategic priorities

The platform proposes a list of potential AI applications such as:

- AI customer support assistant
- automated lead qualification
- intelligent document processing
- automated reporting systems
- customer sentiment analysis

Each use case is presented with estimated impact and implementation complexity.

Phase 6: Prioritization and Consensus

Participants collectively evaluate proposed use cases.

The platform facilitates prioritization through:

- voting mechanisms
- impact vs effort matrices
- consensus detection algorithms

Participants place use cases into a strategic framework that identifies:

- quick wins
- strategic initiatives
- long-term innovations

This process ensures organizational alignment around the most valuable opportunities.

Phase 7: AI Readiness Assessment

The platform evaluates the organization's preparedness for AI adoption.

Assessment criteria include:

- data maturity
- automation infrastructure
- AI expertise
- system integration capabilities

Participants answer short diagnostic questions, and the system calculates an **AI readiness score**.

The readiness assessment highlights strengths and gaps that may affect implementation.

Phase 8: Strategy and Roadmap Generation

Using all insights collected during the workshop, the system produces a structured AI implementation roadmap.

The roadmap is typically divided into phases such as:

Phase 1 – Quick Wins

Early automation initiatives that provide fast value.

Phase 2 – Operational Transformation

Integration of AI into core workflows and systems.

Phase 3 – Advanced Intelligence

Predictive analytics, advanced decision systems, and strategic AI initiatives.

This roadmap provides a practical pathway for AI adoption.

6. Multi-Agent System Architecture

The platform operates using a coordinated set of intelligent agents, each responsible for a specific aspect of the workshop.

Facilitator Agent

Guides the workshop experience, asks questions, and transitions between phases.

Poll and Consensus Agent

Manages live voting, aggregates participant input, and detects alignment across stakeholders.

Prompt Coaching Agent

Evaluates and improves prompts submitted by participants during exercises.

Insight Mining Agent

Analyzes workshop inputs, clusters ideas, detects patterns, and surfaces strategic observations.

Industry Benchmark Agent

Provides contextual recommendations based on industry trends and common AI applications.

Prioritization and ROI Agent

Evaluates use cases based on impact, feasibility, and estimated value.

Deck Builder Agent

Transforms workshop outputs into a structured presentation and report.

7. Key Differentiators

AI Consulting Copilot introduces several capabilities that differentiate it from traditional workshop tools.

Real-Time Insight Detection

The system continuously analyzes participant input and surfaces meaningful observations during the session.

Dynamic Idea Clustering

Responses are automatically grouped into thematic clusters, revealing patterns that may not be immediately visible to participants.

Consensus Detection

The platform identifies when strong agreement emerges around a problem or opportunity.

AI Opportunity Generation

The system automatically proposes AI use cases based on organizational context.

Prompt Coaching

Participants learn how to interact with AI systems effectively through guided prompt engineering exercises.

Automated Consulting Deliverables

The platform generates strategy decks, reports, and opportunity maps without manual post-workshop analysis.

8. Workshop Deliverables

At the end of each session, the platform produces structured outputs including:

- workshop summary report
- prioritized AI use case list
- impact vs effort matrix
- AI readiness assessment
- implementation roadmap
- strategy presentation deck

These deliverables provide organizations with a clear starting point for AI adoption.

9. Target Users

The AI Consulting Copilot platform is designed for multiple stakeholders.

Consulting Firms

Used to run scalable AI discovery workshops for clients.

Enterprise Innovation Teams

Used to identify automation opportunities internally.

Strategy and Transformation Leaders

Used to align cross-functional teams around AI initiatives.

Technology Leaders

Used to translate business challenges into AI implementation opportunities.
